

## DBTA Trend-Setting Products for 2020

### Kourier Integrator

**K**ey data management trends have emerged that are shaping the capabilities of IT products and services for 2020 and beyond.

The assortment of challenges and resulting solutions is wide-ranging. With data flowing into organizations from more sources than ever, the requirement for efficient data integration and data cleansing has never been greater. In addition, due to the growing assortment of data privacy regulations, the need for data governance best practices has also increased. At the same time, a variety of cloud scenarios are on the rise, data warehouse approaches are working alongside data lakes, and numerous data management technologies are being tapped to address specific requirements.

To help support data management processes and decision making, artificial and augmented intelligence is being infused into products and services—in the cloud, the enterprise, and at the edge. DevOps products have emerged to help improve software development, and now DataOps is progressing to enable analytics success.

Yet, as newer approaches come into view, established mainframe, relational database, and MultiValue

technologies are evolving with new features as they continue to maintain strong positions at the enterprise level.

The result is that the range of solution choices is expanding dramatically. The variety of options is evidenced by the frequent use of language such as “multi,” “hybrid,” and “not only” that has surfaced to describe the fact that there is no single approach to data management or analytics.

To help showcase innovative products and services each year, *Database Trends and Applications* magazine looks for offerings that promise to help organizations derive greater benefit from their data, make decisions faster, and do so with higher levels of security.

On the following pages, we present *DBTA’s* list of Trend-Setting Products for 2020. We encourage you to continue your exploration by visiting the companies’ websites for more information.

In addition, in this issue, we include “Product Spotlight” articles penned by company executives that highlight what makes these products unique. ■

# Kourier Integrator

## PRODUCT SPOTLIGHT

Mark Dobransky  
Co-Founder and  
Managing Partner

**KOURIER INTEGRATOR**  
Kore's clients, partners and VARs use Kourier Integrator to extend the value and functionality of their MultiValue systems by creating real-time integration with best-in-class applications such as CRM, eCommerce, service management, transportation logistics and more.

The speed of business continues to increase as do the expectations of end users. To ensure that data is always available and up-to-date, RESTful Web Services are the preferred technology for synchronous, real-time integration between applications.

Kourier REST continues to evolve and support these requirements by providing a comprehensive bi-directional real-time integration platform for MultiValue systems. You can create secure and

“ **The speed of business continues to increase as do the expectations of end users** ”

scalable inbound REST APIs (REST as server) enabling third-party solutions to communicate with your MultiValue system. Build outbound integration with external best-in-class solution REST endpoints

(REST as a client) using application connectors and template-based adaptors.

Kourier already includes powerful features such as a clicks-not-code development environment, a configurable REST Gateway, rate limiting, subscriptions, automatic Swagger documentation and more. The latest release of Kourier adds new trend-setting features too:

- Automatically build, rebuild and maintain integration cross references between systems. This is critical to keeping all systems synchronized.
- A searchable integration timeline maintains a history of events for the lifecycle of each record. View request and response messages to diagnose anomalies then pinpoint and resolve issues.

Application integration can be challenging. We endeavor to create software that makes it as easy as possible while helping developers to be more efficient and productive.
